OBSERVATION RECORD

Project: Cafeteria Pre-Order System

Observation No.: 1

Date: 30/10/2026

Time: 5:00pm – 5:30pm

Location: Abdul Rahman Limbong Cafateria, UMT

Observer(s): K05

1. Objective

To observe the current food ordering process and identify potential problems that could be addressed by the Cafeteria Pre-Order System.

2. Observation Details

Item Observation

- Queue conditions: =Long queues may occur during peak hours, especially during lunch breaks.

- Customer Ordering Process:
  =Customers place their food orders at the counter directly

- Payment process:
  =Customers make payments at the counter after placing their orders.

- Food collection:
  =Customers wait near the counter until their food is ready.

- Vendor order management: =Vendors receive orders directly from customers and prepare them one by one.

3. Problems Identified

- Customers have to wait in long queues during peak hours.
- The ordering process takes time because customers must order directly at the counter.
- Customers may have limited time to buy food between classes.

- Vendors need to manage customer orders manually.
- Crowded counters may cause confusion during food collection.

4. Supporting Evidence

5. Preliminary Findings

Based on the observation, the current cafeteria ordering process requires customers to order, pay, and collect their food physically at the counter. Long queues during peak hours may cause delays and inconvenience for both customers and vendors.

Therefore, a Cafeteria Pre-Order System could help improve the ordering process by allowing students to place their food orders in advance, reducing waiting time and congestion at the cafeteria.
